

Experiment No. 20

Title

Prolog Program for PLANETS Database

Aim

To write a Prolog program to create a database of planets and retrieve information using queries.

Objective

The objective of this experiment is to understand how Prolog facts are used to represent a database of planets and retrieve information through queries.

Algorithm

Step 1: Start.

Step 2: Define facts for the planets.

Step 3: Store the planet information in the Prolog database.

Step 4: Execute a query to retrieve the required planet.

Step 5: Display the result.

Step 6: Stop.

Flowchart

Prolog Program

planet(mercury).

planet(venus).

planet(earth).

planet(mars).

planet(jupiter).

planet(saturn).

planet(uranus).

planet(neptune).

Query:

?- planet(earth).

Sample Output

true.

Result

The Prolog program successfully created a database of planets and retrieved the required information using queries.

Conclusion

Thus, the PLANETS database was successfully implemented in Prolog using facts, and the stored information was retrieved correctly through queries.
