

Experiment No. 22

Title

Prolog Program to Determine Whether a Bird Can Fly or Not

Aim

To write a Prolog program to determine whether a particular bird can fly or not using queries.

Objective

The objective of this experiment is to understand how Prolog facts and rules can be used to determine the flying ability of birds.

Algorithm

1. Start.
2. Define facts for birds that can fly and cannot fly.
3. Define a rule to determine whether a bird can fly.
4. Execute a query for a particular bird.
5. Display the result.
6. Stop.

Flowchart

\ /
v v

Stop

Prolog Program

bird(sparrow).

bird(parrot).

bird(eagle).

bird(penguin).

bird(ostrich).

can_fly(sparrow).

can_fly(parrot).

can_fly(eagle).

cannot_fly(penguin).

cannot_fly(ostrich).

Queries

?- can_fly(sparrow).

Output:

true.

?- can_fly(penguin).

Output:

false.

?- cannot_fly(ostrich).

Output:

true.

Result

The Prolog program successfully determined whether a particular bird can fly or not using suitable queries.

Conclusion

Thus, the flying ability of birds was successfully represented and retrieved using Prolog facts and queries.
