

Experiment No. 28

Title

Prolog Program for Medical Diagnosis

Aim

To write a Prolog program to perform **medical diagnosis based on symptoms**.

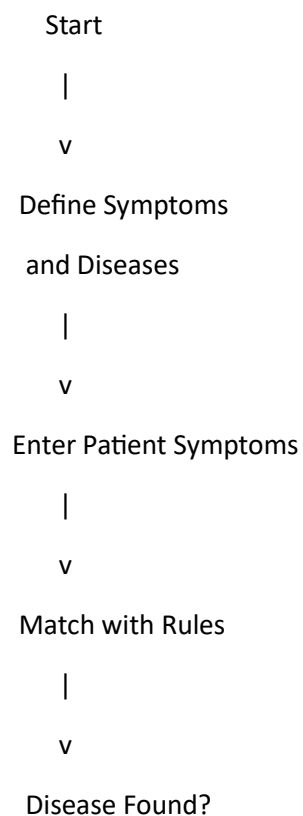

Objective

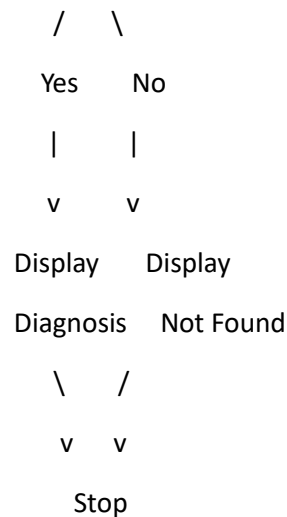

To understand how Prolog facts and rules can be used to identify a possible disease from given symptoms.

Algorithm

1. Start.
2. Define diseases and their symptoms.
3. Define rules for diagnosis.
4. Enter the patient's symptoms.
5. Match the symptoms with the rules.
6. Display the possible disease.
7. Stop.

Flowchart

Prolog Program

symptom(ravi, fever).

symptom(ravi, cough).

symptom(ravi, cold).

diagnosis(Person, flu) :-

 symptom(Person, fever),

 symptom(Person, cough),

 symptom(Person, cold).

diagnosis(Person, malaria) :-

 symptom(Person, fever),

 symptom(Person, chills).

Query

?- diagnosis(ravi, Disease).

Sample Output

Disease = flu.

Result

The Prolog program successfully identified a possible disease based on the symptoms provided.

Conclusion

Thus, a simple **medical diagnosis system** was successfully implemented using Prolog facts and rules.
